

The figure consists of two vertically stacked line graphs sharing a common x-axis representing time (0 to 100). The y-axis for both graphs represents the number of people, with labels from 0 to 100.

Top Graph: The y-axis is labeled with age groups: 0, 10, 20, 30, 40, 50, 60, 70, 80, 90, 100. The graph shows a blue shaded area representing the range of possible outcomes and a dark blue line representing the most likely outcome. The shaded area starts at a wide range (approximately 0 to 100) at time 0 and narrows significantly as time progresses, converging towards a single point at time 100. The dark blue line starts at approximately 80 at time 0 and decreases steadily to 0 at time 100.

Bottom Graph: The y-axis is labeled with age groups: 0, 10, 20, 30, 40, 50, 60, 70, 80, 90, 100. The graph shows a blue shaded area representing the range of possible outcomes and a dark blue line representing the most likely outcome. The shaded area starts at a very narrow range (approximately 0 to 10) at time 0 and widens significantly as time progresses, reaching a wide range (approximately 0 to 100) at time 100. The dark blue line starts at approximately 0 at time 0 and increases steadily to approximately 80 at time 100.
